A NAPPC AND POLLINATOR PARTNERSHIP™ PUBLICATION

---

This guide was funded by the National Fish and Wildlife Foundation, the C.S. Fund, the Plant Conservation Alliance, the U.S. Forest Service, and the Bureau of Land Management with oversight by the Pollinator Partnership™ ([www.pollinator.org](http://www.pollinator.org)), in support of the North American Pollinator Protection Campaign (NAPPC—[www.napcc.org](http://www.napcc.org)).

## WHY SUPPORT POLLINATORS?

IN THEIR 1996 BOOK, *THE FORGOTTEN POLLINATORS*, Buchmann and Nabhan estimated that animal pollinators are needed for the reproduction of 90% of flowering plants and one third of human food crops. Each of us depends on these industrious pollinators in a practical way to provide us with the wide range of foods we eat. In addition, pollinators are part of the intricate web that supports the biological diversity in natural ecosystems that helps sustain our quality of life.

Abundant and healthy populations of pollinators can improve fruit set and quality, and increase fruit size. In farming situations this increases production per acre. In the wild, biodiversity increases and wildlife food sources increase.

Apples, plums, cherries, and raspberries are some of the crops raised in the Adirondack - New England Mixed Forest that rely on honey bees and native bees for pollination. Domestic honey bees pollinate approximately \$10 billion worth of crops in the U.S. each year.

Unfortunately, the numbers of both native pollinators and domesticated bee populations are declining. They are threatened by habitat loss, disease, and the excessive and inappropriate use of pesticides. The loss of commercial bees to Colony Collapse Disorder (CCD) has highlighted how severe the issues of proper hive management are to reduce stresses caused by disease, pesticide use, insufficient nutrition, and transportation practices. Currently, the pollination services that the commercial beekeeping industry provides are receiving much needed research and conservation resources. The efforts to understand the threats to commercial bees should help us understand other pollinators and their roles in the environment as well.

It is imperative that we take immediate steps to help pollinator populations thrive. The beauty of the situation is that by supporting pollinators' need for habitat, we support our own needs for food and support diversity in the natural world.

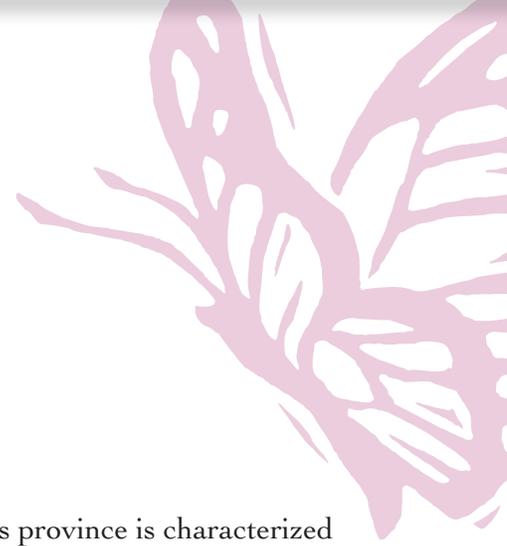

Thank you for taking time to consult this guide. By adding plants to your landscape that provide food and shelter for pollinators throughout their active seasons and by adopting pollinator friendly landscape practices, you can make a difference to both the pollinators and the people that rely on them.

**Laurie Davies Adams**  
Executive Director  
Pollinator Partnership

“**FARMING FEEDS  
THE WORLD, AND  
WE MUST REMEMBER  
THAT POLLINATORS  
ARE A CRITICAL  
LINK IN OUR FOOD  
SYSTEMS.**”

-- PAUL GROWALD,  
CO-FOUNDER,  
POLLINATOR PARTNERSHIP

THIS REGIONAL GUIDE IS just one in a series of plant selection tools designed to provide information on how individuals can influence pollinator populations through choices they make when they farm a plot of ground, manage large tracts of public land, or plant a garden. Each of us can have a positive impact by providing the essential habitat requirements for pollinators including food, water, shelter, and enough space to allow pollinators to raise their young.

Pollinators travel through the landscape without regard to property ownership or state boundaries. We've chosen to use R.G. Bailey's classification system to identify the geographic focus of this guide and to underscore the connections between climate and vegetation types that affect the diversity of pollinators in the environment.

Bailey's Ecoregions of the United States, developed by the United States Forest Service, is a system created as a management tool and is used to predict responses

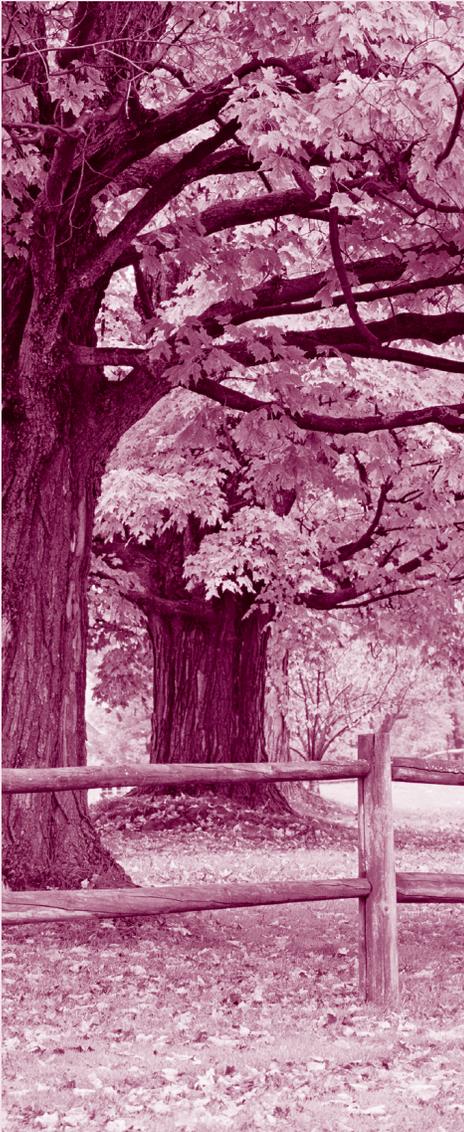

to land management practices throughout large areas. This guide addresses pollinator-friendly land management practices in what is known as the Adirondack - New England Mixed Forest, Coniferous Forest, Alpine Meadow Province.

This 43,600 square mile province extends into six states and is primarily composed of glacier created mountains, plateaus and broad valleys. The mountainous topography ranges from 500 to 5,000 feet, beginning with valleys containing numerous swamps and lakes and rising through forests that vary with elevation. The climate is characterized by warm, moist summers and cold, snowy winters. Annual temperature ranges from 37° to 52°F, reflecting the prevalence of tropical air masses in summer and continental-polar air masses in winter. Since these air masses have year-round access to the eastern seaboard, precipitation is evenly distributed throughout the year. Annual rainfall ranges from 35 to 65 inches and average annual snowfall is more than 100 inches.

This province is characterized by vertical vegetational zonation. Valleys contain a hardwood forest of sugar maple, yellow birch, beech, and hemlock; low mountains support a mixed forest of spruce, fir, maple, birch and beech; above the mixed forest balsam fir and red spruce give way to krummholz at the highest elevations; and above the timberline there is tundra-like growth called alpine meadow.

Long before there were homes and farms in this area, the original, natural vegetation provided continuous cover and adjacent feeding opportunities for wildlife, including pollinators. In choosing plants, aim to create habitat for pollinators that allow adequate food shelter, and water sources. Most pollinators have very small home ranges. You can make a difference by understanding the vegetation patterns of the farm, forest, or neighbor's yard adjacent to you and by making planting choices that support the pollinators' need for food and shelter as they move through the landscape.

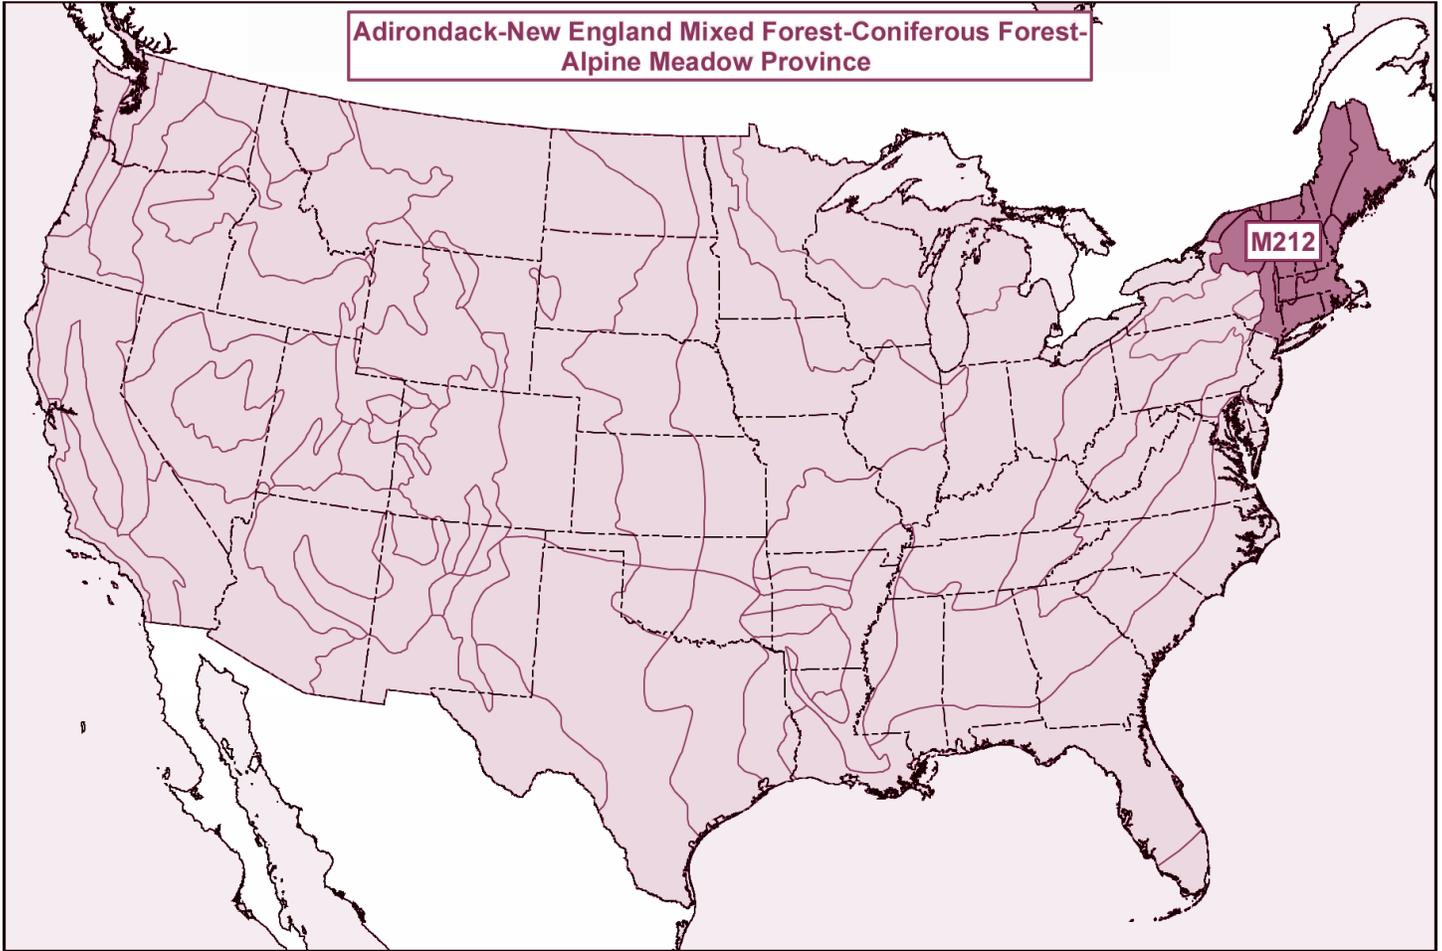

# UNDERSTANDING THE ADIRONDACK - NEW ENGLAND MIXED FOREST

- ✿ This region is designated **number M212** in the Baileys' Ecosystem Provinces. To see a map of the provinces go to: [www.fs.fed.us/colorimagemap/ecoreg1\\_provinces.html](http://www.fs.fed.us/colorimagemap/ecoreg1_provinces.html)
- ✿ Not sure about which bioregion you live or work in? Go to [www.pollinator.org](http://www.pollinator.org) and click on **Ecoregion Locator** for help.
- ✿ 43,600 square miles within six states.
- ✿ Primarily forested and mountainous.
- ✿ Elevations ranging from 500 feet to 5,000 feet.
- ✿ Average annual temperature range from 37° to 52°F.
- ✿ Average year-round precipitation between 35-65 inches.
- ✿ USDA Hardiness Zones 3b-5b.

## CHARACTERISTICS

- ✿ Dominated by mountains and plateaus in transition between boreal spruce-fir forest to the north and deciduous forest to the south.
- ✿ Common tree species include maple, birch, beech, hemlock, spruce, fir, krummholz, and alpine meadow.
- ✿ There is a moisture deficit during the late spring until the arrival of summer rains.
- ✿ The major conversion and degradation threats are development and logging.

The Adirondack - New England  
Mixed Forest  
Coniferous Forest  
Alpine Meadow Province  
includes the states of:

- Maine
- New Hampshire
- Vermont
- New York
- Massachusetts
- Connecticut

## WHO ARE THE POLLINATORS?

### BEES

Bees are well documented pollinators in the natural and agricultural systems of the Adirondack - New England Mixed Forest. A wide range of crops including apples, plums, raspberries, and cherries, are just a few plants that benefit from bee pollinators.

Most of us are familiar with the colonies of honey bees that have been the workhorses of agricultural pollination for years in the United States. They were imported from Europe almost 400 years ago.

There are nearly 4000 species of native ground and twig nesting bees in the U.S. Some form colonies while others live and work a solitary life. Native bees currently pollinate many crops and can be encouraged to do more to support agricultural endeavors if their needs for nesting habitat are met and if suitable sources of nectar, pollen, and water are provided. Bees have tongues of varying lengths that help determine which flowers they can obtain nectar and pollen from.

The bumble bee (*Bombus* spp.) forms small colonies, usually underground. They are generalists, feeding on a wide range of plant material from February to November and are important pollinators of tomatoes. The sweat bee (family *Halictidae*) nests underground. Various species are solitary while others form loose colonies.

Solitary bees include carpenter bees (*Xylocopa* spp.), which nest in wood; digger, or polyester bees (*Colletes* spp.), which nest underground; leafcutter bees (*Megachile* spp.), which prefer dead trees or branches for their nest sites; and mason bees (*Osmia* spp.), which utilize cavities that they find in stems and dead wood. Cactus bees (*Diadasia* spp.) are also solitary ground nesters.

### BUTTERFLIES

Gardeners have been attracting butterflies to their gardens for some time. These insects tend to be eye-catching, as are the flowers that attract them. Position flowering plants where they have full sun and are protected from the wind. Also, you will need to provide open areas (e.g. bare earth, large stones) where butterflies may bask, and moist soil from which they may get needed minerals. By providing a safe place to eat and nest, gardeners can also support the pollination role that butterflies play in the landscape. It might mean accepting slight damage to the plants, known as host plants, that provide food for the larval stage of the butterfly.

A diverse group of butterflies are present in garden areas and woodland edges that provide bright flowers, water sources, and specific host plants. Numerous trees, shrubs, and herbaceous plants support butterfly populations.

Butterflies are in the Order *Lepidoptera*. Some of the species in the Adirondack - New England

Mixed Forest are Jutta arctic, Mottled duskywing, Silvery Blue, Tiger Swallowtail, and Tawny Crescent butterflies. They usually look for flowers that provide a good landing platform.

Wet mud areas provide butterflies with both the moisture and minerals they need to stay healthy. Butterflies eat rotten fruit and even dung, so don't clean up all the messes in your garden!

## MOTHS

Moths are most easily distinguished from butterflies by their antennae. Butterfly antennae are simple with a swelling at the end. Moth antennae differ from simple to featherlike, but never have a swelling at the tip. In addition, butterflies typically are active during the day; moths at night. Butterfly bodies are not very hairy, while moth bodies are quite hairy and more stout.

Moths, generally less colorful than butterflies, also play a role in pollination. They are attracted to flowers that are strongly sweet smelling, open in late afternoon or night, and are typically white or pale colored.

## BEETLES

Over 30,000 species of beetles are found in the United States and many of them can be found on flower heads. Gardeners have yet to intentionally draw beetles to their gardens, possibly because beetle watching isn't as inspiring

as butterfly or bird watching. Yet beetles do play a role in pollination. Some have a bad reputation because they can leave a mess behind, damaging plant parts that they eat. Beetles are not as efficient as some pollinators. They wander between different species, often dropping pollen as they go.

Beetle pollinated plants tend to be large, strong scented flowers with their sexual organs exposed. They are known to pollinate Magnolia, sweetshrub (*Calycanthus*), paw paws, and yellow pond lilies.

## FLIES

It may be hard to imagine why one would want to attract flies to the garden. However, like beetles, the number of fly species and the fact that flies are generalist pollinators (visit many species of plants), should encourage us all to leave those flies alone and let them do their job as pollinators.

Recent research indicates that flies primarily pollinate small flowers that bloom under shade and in seasonally moist habitats. The National Research Council's *Status of Pollinators in North America* study states that flies are economically important as pollinators for a range of annual and bulbous ornamental flowers.

Plants pollinated by the fly include the American pawpaw (*Asimina triloba*), dead horse arum (*Helicodiceros muscivorus*), skunk cabbage (*Symplocarpus foetidus*),

goldenrod (*Solidago* spp.), and members of the carrot family like Queen Anne's lace (*Daucus carota*).

## BIRDS

Hummingbirds are the primary birds which play a role in pollination in North America. Their long beaks and tongues draw nectar from tubular flowers. Pollen is carried on both the beaks and feathers of different hummingbirds. The regions closer to the tropics, with warmer climates, boast the largest number of hummingbird species and the greatest number of native plants to support the bird's need for food. White-winged doves (*Zenaidura asiatica*) are also pollinators of the saguaro cactus (*Carnegieia gigantea*) in the south central United States.

Bright colored tubular flowers attract hummingbirds to gardens throughout the United States. Hummingbirds can see the color red; bees cannot. Adirondack - New England Mixed Forest trumpet creepers and bee balm attract the rubythroated hummingbird.

## BATS

Though bats in the Adirondack - New England Mixed Forest are not pollinators, bats play an important role in pollination in the other regions of the southwest where they feed on agave and cactus. The long-nosed bats' head shape and long tongue allows it to delve into flower blossoms and extract both pollen and nectar.

## PLANT TRAITS

### WHICH FLOWERS DO THE POLLINATORS PREFER?

NOT ALL POLLINATORS ARE found in each North American province, and some are more important in different parts of the United States. Use this page as a resource to understand the plants and pollinators where you live.

Plants can be grouped together based on the similar characteristics of their flowers. These floral characteristics can be useful to predict the type of pollination method or animal that is most effective for that group of plants. This association between floral characteristics and pollination method is called a pollination syndrome.

The interactions of animal pollinators and plants have influenced the evolution of both groups of organisms. A mutualistic relationship between the pollinator and the plant species helps the pollinator find necessary pollen and nectar sources and helps the plant reproduce by ensuring that pollen is carried from one flower to another.

Plant Trait	Bats	Bees	Beetles
Color	Dull white, green or purple	Bright white, yellow, blue, or UV	Dull white or green
Nectar guides	Absent	Present	Absent
Odor	Strong musty; emitted at night	Fresh, mild, pleasant	None to strongly fruity or fetid
Nectar	Abundant; somewhat hidden	Usually present	Sometimes present; not hidden
Pollen	Ample	Limited; often sticky and scented	Ample
Flower Shape	Regular; bowl shaped – closed during day	Shallow; have landing platform; tubular	Large bowl-like, Magnolia

This chart and more information on pollinator syndromes can be found at:

## AND THE POLLINATORS THEY ATTRACT

### Pollinator

Birds	Butterflies	Flies	Moths	Wind
Scarlet, orange, red or white	Bright, including red and purple	Pale and dull to dark brown or purple; flecked with translucent patches	Pale and dull red, purple, pink or white	Dull green, brown, or colorless; petals absent or reduced
Absent	Present	Absent	Absent	Absent
None	Faint but fresh	Putrid	Strong sweet; emitted at night	None
Ample; deeply hidden	Ample; deeply hidden	Usually absent	Ample; deeply hidden	None
Modest	Limited	Modest in amount	Limited	Abundant; small, smooth, and not sticky
Large funnel like; cups, strong perch support	Narrow tube with spur; wide landing pad	Shallow; funnel like or complex and trap-like	Regular; tubular without a lip	Regular; small and stigmas exerted

# DEVELOPING LANDSCAPE PLANTINGS THAT PROVIDE POLLINATOR HABITAT

WHETHER YOU ARE A FARMER of many acres, land manager of a large tract of land, or a gardener with a small lot, you can increase the number of pollinators in your area by making conscious choices to include plants that provide essential habitat for bees, butterflies, moths, beetles, hummingbirds and other pollinators.

## FOOD:

Flowers provide nectar (high in sugar and necessary amino acids) and pollen (high in protein) to pollinators.

Fermenting fallen fruits also provide food for bees, beetles and butterflies.

Specific plants, known as host plants, are eaten by the larvae of pollinators such as butterflies.

- Plant in groups to increase pollination efficiency. If a pollinator can visit the same type of flower over and over, it doesn't have to relearn how to enter the flower and can transfer pollen to the same species, instead of squandering the pollen on unreceptive flowers.
- Plant with bloom season in mind, providing food from early spring to late fall. (see Bloom Periods pp.16-17)
- Plant a diversity of plants to support a variety of pollinators. Flowers of different color, fragrance, and season of bloom on plants of different heights will attract different pollinator species and provide pollen and nectar throughout the seasons.
- Many herbs and annuals, although

not native, are very good for pollinators. Mint, oregano, garlic, chives, parsley and lavender are just a few herbs that can be planted. Old fashioned zinnias, cosmos, and single sunflowers support bees and butterflies.

- Recognize weeds that might be a good source of food. For example, dandelions provide nectar in the early spring before other flowers open. Plantain is alternate host for the Baltimore Checkerspot.
- Learn and utilize Integrated Pest Management (IPM) practices to address pest concerns. Minimize or eliminate the use of pesticides.

## SHELTER:

Pollinators need protection from severe weather and from predators as well as sites for nesting and roosting.

- Incorporate different canopy layers in the landscape by planting trees, shrubs, and different-sized perennial plants.
- Leave dead snags for nesting sites of bees, and other dead plants and leaf litter for shelter.
- Build bee boxes to encourage solitary, non-aggressive bees to nest on your property.
- Leave some areas of soil uncovered to provide ground nesting insects easy access to underground tunnels.
- Group plantings so that pollinators can move safely through the landscape protected from predators.
- Include plants that are needed

by butterflies during their larval development.

## WATER:

A clean, reliable source of water is essential to pollinators.

- Natural and human-made water features such as running water, pools, ponds, and small containers of water provide drinking and bathing opportunities for pollinators.
- Ensure the water sources have a shallow or sloping side so the pollinators can easily approach the water without drowning.

Your current landscape probably includes many of these elements. Observe wildlife activity in your farm fields, woodlands, and gardens to determine what actions you can take to encourage other pollinators to feed and nest. Evaluate the placement of individual plants and water sources and use your knowledge of specific pollinator needs to guide your choice and placement of additional plants and other habitat elements. Minor changes by many individuals can positively impact the pollinator populations in your area. Watch for - and enjoy - the changes in your landscape!

- **CAUTION:** Remember that pesticides are largely toxic to pollinators. Extreme caution is warranted if you choose to use any pesticide. Strategically apply pesticides only for problematic target species.

# FARMS

Apples, plums, raspberries, and cherries are a few of the food crops in the Adirondack - New England Mixed Forest Province that will benefit from strong native bee populations that boost pollination efficiency. Incorporate different plants throughout the farm that provide food for native populations when targeted crops are not in flower.

Farmers have many opportunities to incorporate pollinator-friendly land management practices on their land which will benefit the farmer in achieving his or her production goals:

- Manage the use of pesticides to reduce the impact on native pollinators. Spray when bees aren't active (just after dawn) and choose targeted ingredients.
- Carefully consider the use of

herbicides. Perhaps the targeted weeds can provide needed food for pollinators.

- Minimize tillage to protect ground nesting pollinators.
- Ensure water sources are scattered throughout the landscape.
- Choose a variety of native plants to act as windbreaks, riparian buffers, and field borders throughout the farm.
- Plant unused areas of the farm with temporary cover crops that can provide food or with a variety of trees, shrubs, and flowers that provide both food and shelter for pollinators.
- Check with your local Natural Resources Conservation Service (NRCS) office to see what technical and financial support might be available to assist you in your effort to provide nectar, pollen, and larval food sources for pollinators on your farm.

“**FOOD SUPPLIES FOR BEES ARE CRITICAL TO MAINTAINING STRONG HIVES FOR ALMOND POLLINATION THE FOLLOWING WINTER.**”

-- DAN CUMMINGS, CHICO, CALIFORNIA ALMOND GROWER.

Illustrations by Carolyn Vibbert

## PUBLIC LANDS

“FROM HUMMINGBIRDS TO BEETLES, TO BUTTERFLIES, NATURE’S POLLINATORS HELP KEEP MIDWIN’S TALLGRASS PRAIRIE RESTORATIONS FULL OF DIVERSE FLOWERING PLANTS. INSECT MONITORING PROVIDES A KEY MEASURE OF OUR SUCCESS.”

-- LOGAN LEE  
PRAIRIE SUPERVISOR, MIDWIN  
NATIONAL TALLGRASS PRAIRIE

Public lands are maintained for specific reasons ranging from high impact recreation to conservation. In the Adirondack - New England Mixed Forest, forests have been cut for timber and the substantial development of second homes, agriculture and ecotourism. Less disturbed natural areas can be augmented with plantings of native plant species. Existing plantings around buildings and parking areas should be evaluated to determine if pollinator-friendly plants can be substituted or added to attract and support pollinators. Public land managers have a unique opportunity to use their plantings as an education tool to help others understand the importance of pollinators in the environment through signs, brochures, and public

programs.

In an effort to increase populations of pollinators the land manager can:

- Inventory and become knowledgeable of local pollinators.
- Provide connectivity between vegetation areas by creating corridors of perennials, shrubs, and trees that provide pollinators shelter and food as they move through the landscape.
- Maintain a minimum of lawn areas that support recreational needs.
- Restrict the use of pesticides and herbicides.
- Provide water sources in large open areas.
- Maintain natural meadows and openings that provide habitats for sun-loving wildflowers and grasses.
- Remove invasive species and encroaching shrubs and trees.

**“ A GARDEN IS ONLY AS RICH AND BEAUTIFUL AS THE INTEGRAL HEALTH OF THE SYSTEM; POLLINATORS ARE ESSENTIAL TO THE SYSTEM - MAKE YOUR HOME THEIR HOME. ”**

**-- DERRY MACBRIDE  
NATIONAL AFFAIRS AND  
LEGISLATION CHAIRWOMAN,  
GARDEN CLUB OF AMERICA**

Gardeners have a wide array of plants to use in their gardens. Native plants, plants introduced from years of plant exploration from around the world, and plants developed by professional and amateur breeders can be found in garden centers, in catalogs, and on web-sites. Use your knowledge of pollinator needs to guide your choices.

- Choose a variety of plants that will provide nectar and pollen throughout the growing season.
- Resist the urge to have a totally manicured lawn and garden. Leave bare ground for ground nesting bees. Leave areas of dead wood and leaf litter for other insects.
- Strive to eliminate the use of all pesticides.
- Find local resources to help you in your efforts. Contact your local county extension agent or native plant society. Visit your regional botanic gardens and arboreta.

The scale of your plantings will vary but it is important to remember that you are trying to provide connectivity to the landscape adjacent to your property. Don't just look within your property boundaries. If your neighbor's property provides an essential element, such as water, which can be utilized by pollinators visiting your land, you may be able to devote more space to habitat elements that are missing nearby. It is best to use native plants which have evolved to support the needs of specific native pollinators. Some pollinators, however, are generalists and visit many different plants, both native and non-native. Be sure that any non-native plants you choose to use are not invasive. Remember that specialized cultivars sometimes aren't used by pollinators. Flowers that have been drastically altered, such as those that are double or a completely different color than the wild species, often prevent pollinators from finding and feeding on the flowers. In addition, some altered plants don't contain the same nectar and pollen resources that attract pollinators to the wild types.

- **CAUTION:** Take time to evaluate the source of your plant material. You want to ensure you get plants that are healthy and correctly identified. Your local native plant society can help you make informed decisions when searching for plants.

# BLOOM PERIODS

## FOR THE ADIRONDACK - NEW ENGLAND MIXED FOREST

The following chart lists plants and the time they are in bloom throughout the growing seasons. Choose a variety of flower colors and make sure something is blooming at all times! Note for all charts: When more than one species of the same genus is useful, the genus name is followed by "spp."

Botanical Name	Common Name	April	May	June	July	Aug	Sept	Oct	Nov
<b>Trees &amp; Shrubs</b>									
<i>Amelanchier stolonifera</i>	running service berry		white	white					
<i>Arctostaphylos uva-ursi</i>	kinnikinnick		purple blue	purple blue					
<i>Ceanothus americanus</i>	New Jersey tea			white	white	white			
<i>Chamaedaphne calyculata</i>	leatherleaf		white	white	white				
<i>Cornus rugosa</i>	roundleaf dogwood		white	white	white				
<i>Diervilla lonicera</i>	bush honeysuckle			yellow	yellow				
<i>Dasiphora fruticosa</i>	shrubby cinquefoil		yellow	yellow	yellow				
<i>Epigaea repens</i>	trailing arbutus		white to pink	white to pink	white to pink				
<i>Gaultheria procumbens</i>	eastern teaberry			pink	pink	pink			
<i>Hamamelis virginiana</i>	American witchhazel						yellow	yellow	yellow
<i>Ilex mucronata</i>	catberry			inconspicuous	inconspicuous				
<i>Ilex verticillata</i>	common winterberry			white	white				
<i>Photinia melanocarpa</i>	black chokeberry		white	white					
<i>Prunus virginiana</i>	chokecherry			white					
<i>Rhododendron canadense</i>	rhodora		rose pink	rose pink	rose pink				
<i>Rosa virginiana</i>	Virginia rose			rose pink	rose pink				
<i>Sorbus americana</i>	American mountain ash			white					
<i>Spiraea alba</i>	white meadowsweet			white to pink	white to pink	white to pink	white to pink		
<i>Symphoricarpos albus</i>	common snowberry			pink	pink				
<i>Vaccinium corymbosum</i>	highbush blueberry			white	white				
<i>Viburnum acerifolium</i>	mapleleaf viburnum		white	white					
<b>Perennial Flowers</b>									
<i>Actaea pachypoda</i>	white baneberry		white	white					
<i>Aquilegia canadensis</i>	red columbine		red, yellow	red, yellow	red, yellow				
<i>Asarum canadense</i>	Canadian wild ginger		maroon	maroon					
<i>Asclepias incarnata</i>	swamp milkweed			pink	pink	pink			

Botanical Name	Common Name	April	May	June	July	Aug	Sept	Oct	Nov
<i>Caltha palustris</i>	marsh marigold		yellow	yellow					
<i>Cardamine concatenata</i>	cutleaf toothwort		white	white					
<i>Chelone glabra</i>	white turtlehead				white	white	white		
<i>Eupatorium purpureum</i>	sweet scented joe-pye-weed				pink to lavender	pink to lavender			
<i>Eurybia macrophylla</i>	bigleaf aster					white to pale blue, yellow center	white to pale blue, yellow center	white to pale blue, yellow center	
<i>Geum rivale</i>	water avens			purplish red	purplish red				
<i>Gentiana clausa</i>	bottle gentian					blue, violet	blue, violet		
<i>Lilium canadense</i>	Canada lily			red, orange	red, orange	red, orange			
<i>Lobelia cardinalis</i>	cardinal flower					red, orange	red	red	
<i>Lupinus perennis</i>	sundial lupine			blue, violet	blue, violet				
<i>Maianthemum racemosum</i>	feathery false lily of the valley		white	white					
<i>Monarda fistulosa</i>	wild bergamont				lavender pink to violet blue	lavender pink to violet blue	lavender pink to violet blue		
<i>Packera aurea</i>	golden ragwort		dark yellow	dark yellow					
<i>Penstemon hirsutus</i>	hairy beardtongue			pink to violet blue	pink to violet blue				
<i>Rudbeckia hirta</i>	black-eyed susan			yellow with dark brown center	yellow with dark brown center	yellow with dark brown center	yellow with dark brown center		
<i>Solidago caesia</i>	wreath goldenrod					yellow	yellow		
<i>Symplocarpus foetidus</i>	skunk cabbage	dark maroon	dark maroon						
<i>Tiarella cordifolia</i>	foamflower		white	white					
<i>Trientalis borealis</i>	starflower		white	white					
<i>Trillium grandiflorum</i>	white trillium		white	white					
<i>Uvularia grandiflora</i>	large bellwort		yellow	yellow					
<i>Viola adunca</i>	hookedspur violet		rose pink to violet	rose pink to violet	rose pink to violet				
<i>Zizia aurea</i>	golden zizia		yellow	yellow	yellow				
<i>Celastrus scandens</i>	American bittersweet			yellowish white	yellowish white				
<i>Clematis virginiana</i>	virgin's bower				white	white			
<i>Linnaea borealis</i>	twinflower			pink	pink	pink			
<i>Mitchella repens</i>	partridgeberry			white	white	white			

# PLANTS THAT ATTRACT POLLINATORS

## FOR THE ADIRONDACK - NEW ENGLAND MIXED FOREST

The following chart lists plants that attract pollinators. It is not exhaustive, but provides guidance on where to start. Annuals, herbs, weeds, and cover crops provide food and shelter for pollinators, too.

Botanical Name	Common Name	Color	Ht.	Flower Season	Sun	Soil	Visitation by Pollinator	Also a host
<b>Trees &amp; Shrubs</b>								
<i>Amelanchier stolonifera</i>	running service berry	white	5'	May-June	sun to partial sun	moist to dry	bees, flies	X
<i>Arctostaphylos uva-ursi</i>	kinnikinnick	purple-blue	2-6"	May-June	sun to partial sun	sands, excessively drained	bees	X
<i>Ceanothus americanus</i>	New Jersey tea	white	1-3'	June-August	sun to partial sun	dry	bees, flies, beetles, butterflies	X
<i>Chamaedaphne calyculata</i>	leatherleaf	white	1-3'	May-July	sun to partial sun	wet	bees, flies, butterflies	X
<i>Cornus rugosa</i>	roundleaf dogwood	white	6-9'	May-August	sun to shade	moist to dry	bees, beetles, flies, butterflies	X
<i>Diervilla lonicera</i>	bush honeysuckle	yellow	6-36"	June-July	sun to shade	dry to moist	bees, moths	X
<i>Dasiphora fruticosa</i>	shrubby cinquefoil	yellow	3-4'	May-July	sun to partial sun	dry to wet	bees, flies, butterflies	X
<i>Epigaea repens</i>	trailing arbutus	white to pink	1-3"	May-July	sun to partial sun	moist	bees	X
<i>Gaultheria procumbens</i>	eastern teaberry	pink	4-8"	May-July	sun to partial sun	sun to shade	bees	X
<i>Hamamelis virginiana</i>	American witchhazel	yellow	12-15'	Sept-Nov	moist	sun to shade	moths	X
<i>Ilex mucronata</i>	catberry	inconspicuous	6-8'	June-July	moist to wet	sun to shade	bees, flies	X
<i>Ilex verticillata</i>	common winterberry	white	6-10'	June-July	moist to wet	sun to shade	bees, flies	X
<i>Photinia melanocarpa</i>	black chokeberry	white	4-6'	May-June	sun to partial sun	dry to moist	bees, beetles, flies	X
<i>Prunus virginiana</i>	chokecherry	white	20'+	June	sun to partial sun	moist	bees	X
<i>Rhododendron canadense</i>	rhodora	rose pink	3-4'	June-July	sun to partial sun	moist to wet	bees, hummingbirds	X
<i>Rosa virginiana</i>	Virginia rose	rose pink	4-6'	June-July	sun	dry to moist	bees	X
<i>Sorbus americana</i>	American mountain ash	white	to 30'	June-July	sun to partial sun	moist	bees, flies	X
<i>Spiraea alba</i>	white meadowsweet	white to pink	3-6'	June-Sept	sun	dry to wet	bees, flies, beetles	X
<i>Symphoricarpos albus</i>	common snowberry	pink	3-4'	June-July	sun to partial sun	dry	bees	X
<i>Vaccinium corymbosum</i>	highbush blueberry	white	7-9'	June-July	sun to partial sun	moist	bees	X
<i>Viburnum acerifolium</i>	mapleleaf viburnum	white	4-5'	May-June	shade to sun	dry to moist	bees, beetles, flies	X
<b>Perennial Flowers</b>								
<i>Actaea pachypoda</i>	white baneberry	white	18-36"	May-June	partial sun	moist	bees, beetles, flies	X
<i>Aquilegia canadensis</i>	red columbine	red, yellow	12-36"	May-July	partial shade to sun	well drained	hummingbirds, bees	X
<i>Asarum canadense</i>	Canadian wild ginger	maroon	2-8"	May-June	shade to partial sun	moist	slugs, beetles	
<i>Asclepias incarnata</i>	swamp milkweed	pink	12-54"	June-July	sun to partial sun	moist to wet	bees, beetles, flies, butterflies	X

Botanical Name	Common Name	Color	Ht.	Flower Season	Sun	Soil	Visitation by Pollinator	Also a host
<i>Caltha palustris</i>	marsh marigold	yellow	10-22"	May-June	sun to shade	moist to wet	flies, bees	X
<i>Cardamine concatenata</i>	cutleaf toothwort	white	8-16"	May-June	partial sun to shade	moist	bees, bee flies, butterflies	X
<i>Chelone glabra</i>	white turtlehead	white	28-36"	July-Sept	sun to partial sun	wet to moist	bees	X
<i>Eupatorium purpureum</i>	sweet scented joe-pye-weed	pink to lavender	24-72"	July-Aug	partial shade to sun	moist to wet	bees, butterflies, moths	X
<i>Eurybia macrophylla</i>	bigleaf aster	white to pale blue, yellow center	12-42"	August-October	sun to partial sun	moist	bees, butterflies, beetles, wasps	X
<i>Geum rivale</i>	water avens	purplish red	14-24"	June-July	sun to partial sun	moist to wet	bees, flies, beetles	X
<i>Gentiana clausa</i>	bottle gentian	blue, violet	18-24"	August-Sept	sun to partial sun	moist	bees	X
<i>Lilium canadense</i>	Canada lily	red orange	3-5'	June-August	sun to partial sun	moist to wet	hummingbirds	
<i>Lobelia cardinalis</i>	cardinal flower	red	24-60"	Aug-Oct	sun to partial shade	moist to wet	bees, hummingbirds	
<i>Lupinus perennis</i>	sundial lupine	blue, violet	8-24"	June-July	sun to partial sun	dry	bees	X
<i>Maianthemum racemosum</i>	feathery false lily of the valley	white	16-32"	May-June	partial sun to shade	moist	bees, flies	
<i>Monarda fistulosa</i>	wild bergamont	lavendar pink to violet blue	24-46"	July-Sept	sun to partial sun	moist	bees, wasps, butterflies, hummingbirds	X
<i>Packera aurea</i>	golden ragwort	dark yellow	10-22'	May-June	sun to shade	moist to wet	bees, flies, butterflies, moths	X
<i>Penstemon hirsutus</i>	hairy beardtongue	pink to violet blue	12-18"	June-July	sun to partial sun	moist to dry	bees	X
<i>Rudbeckia hirta</i>	black-eyed susan	yellow with dark brown center	16-40"	June-Sept	sun to partial sun	moist to dry	bees, butterflies, beetles, wasps	X
<i>Solidago caesia</i>	wreath goldenrod	yellow	18-36'	August to Sept	sun to shade	moist to dry	bees, beetles, flies, butterflies	
<i>Symplocarpus foetidus</i>	skunk cabbage	dark maroon	24-36"	April-May	sun to shade	wet to flooded	beetles, flies	
<i>Tiarella cordifolia</i>	foamflower	white	4-14"	June-May	sun to shade	moist	bees, bee flies	
<i>Trientalis borealis</i>	starflower	white	4-8"	May-June	partial sun to shade	moist to wet	beetles, bees, butterflies	
<i>Trillium grandiflorum</i>	white trillium	white	8-16"	May-June	partial sun	moist	bees, beetles, flies, butterflies	
<i>Uvularia grandiflora</i>	large bellwort	yellow	8-20"	May-June	partial sun to shade	moist	bees	
<i>Viola adunca</i>	hookedspur violet	rose pink to violet	3-6"	May-July	sun to partial shade	moist to dry	bees	X
<i>Zizia aurea</i>	golden zizia	yellow	14-38"	May-July	sun to partial sun	moist to wet	flies, bees	X
<b>Vines</b>								
<i>Celastrus scandens</i>	American bittersweet	yellowish white	48'+	June-July	sun to partial sun	dry to moist	bees	
<i>Clematis virginiana</i>	virgin's bower	white	9'	July-Aug	sun to partial sun	moist	flies, bees	
<i>Linnaea borealis</i>	twinline	pink	5"	June-August	partial sun	moist	bees, wasps	
<i>Mitchella repens</i>	partridgeberry	white	10-16"	June-August	partial sun	moist	bees	

# HABITAT HINTS

## FOR THE ADIRONDACK - NEW ENGLAND MIXED FOREST

### HABITAT REQUIREMENTS FOR BEE-POLLINATED GARDEN FLOWERS AND CROPS

Water melon	x							x			
Squash/ Pumpkins/ Gourds			x		x						
Tomatoes	x	x	x					x			
Thyme	x	x					x	x		x	

## HABITAT AND NESTING REQUIREMENTS:

### **Bumble Bees:**

Abandoned mouse nests, other rodent burrows, upside down flower pots, under boards, and other human-made cavities. Colonies are founded by a queen in the spring and don't die out in the fall. New queens mate then and overwinter in a sort of hibernation. Bumble bees are usually active during the morning hours and forage at colder temperatures than honey bees, even flying in light rain.

### **Large carpenter bees:**

Soft dead wood, poplar, cottonwood or willow trunks and limbs, structural timbers including redwood. Depending on the species, there may be one or two brood cycles per year. These bees can be active all day even in the hottest weather.

### **Digger bees:**

Sandy soil, compacted soils, bank sides. Anthophorid bees (now in the Apidae) are usually active in the morning hours, but can be seen at other times.

### **Small carpenter bees:**

Pithy stems including roses and blackberry canes. These bees are more active in the morning but can be found at other times.

### **Squash and Gourd bees:**

Sandy soil, may nest in gardens (where pumpkins, squash and gourds are grown) or pathways. These bees are early risers and can be found in pumpkin patches before dawn. Males often sleep in the wilted flowers.

### **Leafcutter bees:**

Pre-existing circular tunnels of various diameters in dead but sound wood created by emerging beetles, some nest in the ground. Leave dead limbs and trees to support not just pollinators but other wildlife. Leafcutter bees can be seen foraging throughout the day even in hot weather.

### **Mason bees:**

Pre-existing tunnels, various diameters in dead wood made by emerging beetles, or human-made nesting substrates, drilled wood boards, paper soda straws inserted into cans attached to buildings. Mason bees are generally more active in the morning hours.

### **Sweat bees:**

Bare ground, compacted soil, sunny areas not covered by vegetation. Like most bees, sweat bees forage for pollen earlier in the morning and then for nectar later.

### **Plasterer or cellophane bees:**

Bare ground, banks or cliffs. Colletid bees can be active in the morning or later in the day.

### **Yellow-faced bees:**

In dead stems. These bees are more active during morning hours.

### **Andrenid bees:**

Sunny, bare ground, sand soil, under leaf litter or in soil in banksides and cliffs. These generally spring-active bees are most commonly seen on flowers during the morning when pollen and nectar resources are abundant.

**“MONARCH  
BUTTERFLIES  
NEVER FAIL TO  
CATCH THE  
VISITOR’S EYE  
AND ALWAYS  
LEAD TO  
A TEACHABLE  
MOMENT.”**

PRAIRIE SUPERVISOR  
MIDWIN NATIONAL  
TALLGRASS PRAIRIE

### BECOME FAMILIAR WITH POLLINATORS IN YOUR LANDSCAPE.

- ✿ Watch for activity throughout the day and the seasons.
- ✿ Keep a simple notebook of when and what comes to your garden.  
NOTE: It is not necessary to identify each species when you first get started. Simply note if it is a bee that likes the yellow flower that blooms in the fall.
- ✿ Consult a local field guide or web site when you are ready to learn more details.

### ADD NATIVE PLANTS TO ATTRACT MORE NATIVE POLLINATORS.

- ✿ List the plants you currently have in your landscape.
- ✿ Determine when you need additional flowers to provide nectar and pollen throughout the growing season.
- ✿ Add plants that provide additional seasons of bloom, create variable heights for shelter, and attract the types of pollinators you want.
- ✿ Don't forget to include host plants that provide food and shelter for larval development.
- ✿ Contact your local native plant society or extension agent for more help.

### USE POLLINATOR FRIENDLY LANDSCAPE PRACTICES TO SUPPORT THE POLLINATORS YOU ATTRACT.

- ✿ Use Integrated Pest Management Practices to address pest concerns.
- ✿ Tolerate a little mess – leave dead snags and leaf litter, keep areas bare for ground nesting insects, and leave some weeds that provide food for pollinators.
- ✿ Provide safe access to clean water.

### NOTICE THE CHANGES THAT YOU HAVE HELPED TO CREATE!

## RESOURCES

Many books, websites, and people were consulted to gather information for this guide. Use this list as a starting point to learn more about pollinators and plants in your area.
