

OFFICE OF THE GOVERNOR

June 18-24, 2018

California Pollinator Week

Pollinator species such as birds and insects are essential partners to farmers and ranchers in producing much of our food supply. Pollinators also provide significant environmental benefits that are necessary for maintaining biodiversity and healthy ecosystems.

The health of our national forests and grasslands depends on pollination. These open spaces provide forage, fish and wildlife, timber, water, mineral resources and recreational opportunities for our communities and the vital industries that serve them.

The state of California provides producers with conservation assistance to promote wise stewardship of lands and habitats, including the protection and maintenance of pollinators on working lands and wild lands.

As Governor of the state of California, I urge all citizens to recognize the important role that pollination plays in our state's economy and ecosystems.

Sincerely,

EDMUND G. BROWN JR.
